

Cyclic Redundancy Check

Software Modules

ABSTRACT

This routine calculates a cyclic redundancy check with a fast table-driven algorithm.

Contents

1. Introduction.....	1
2. Software Interface.....	1
3. About Simma Software.....	3

1 Introduction

This routine calculates a cyclic redundant check, which is used to detect accidental changes to raw computer data. Once the cyclic redundancy check was calculated the program does a bitwise inversion before sending back the result.

2 Software Interface

The `crc_buf` method calculates the cyclic redundant check with a series of values versus `crc_8` method which calculates the cyclic redundant check for an 8-bit value.

2.1 Source Code

The archive for this software contains all the necessary header files to enable the code and run the functions: [crc.c](#) and [crc.h](#)

2.2 Software Flow

The `crcbuf` method loops through the input data and uses a lookup table and the cyclic redundant formula to calculate the 16-bit CRC value.

2.3 Header File – ‘`crc.h`’

```
/*
** Simma Software, Inc.
** https://www.simmasoftware.com
*/
#ifndef __CRC_H__
#define __CRC_H__
#include <stdint.h>

extern uint16_t
crc_8( uint16_t crcvalue, uint8_t val );

extern uint16_t
crc_buf( uint16_t crcvalue, uint8_t *buf, uint16_t size );

#endif
```

2.4 Source Code – 'crc.c'

```

#include <stdint.h>
#include "crc.h"

/* CRC lookup table. */
uint16_t const static crctable[256] =

3 About Simma Software, the [SAE J1939](#) and [UDS](#) Experts

Simma Software, Inc. specializes in real-time embedded software for the automotive industry. Products and services include protocol stacks, bootloaders, device drivers, training, and consultation on the following technologies: J1939, CAN, CAN FD, J1587, J1708, J2497, J1922, J1979, ISO 15765, OBD-II, CANopen, UDS, XCP, NMEA2000, and Secure Boot.
